IMPORTANT SAFETY INSTRUCTIONS
Read these safety instructions entirely!
Read and understand all safety instructions before operating machine.

Precaution in installation and operation

*Don't place the detector in an extreme hot or cold condition, and avoid setting the machine close to the heating radiator, tap, air humidifier and stoves.

*Don't place the detector near the window under the direct sunshine. In case of inevitable, the window curtain, shield and hood should be used to shade the detector.

*No contact of the machine is allowed with dust, ammonium, alcohol, diluents and pulverized adhesive, etc.

*The detector should be installed on a leveled ground.

*Never place it close to the air compressor or any substance that may generate vibration.

*During the operation don't close to the detector unless the operator.

*The dynamic balance detector should use separated power socket. Don't connect any other wire in this socket.

Attention must be paid to the reliable grounding, if there is no grounding connection in the socket, it must be added before connect with the power source.

*The wire line of dynamic balance detector should be prevented from stepping on.

*A space of 50 cm width should be left between the wall and detector to ensure the ventilation for heat. Spaces also should be left on the left and right sides of the machine for operator to operate the machine without obstacle.

*Contact with the special service man for maintenance before you have to move the dynamic balance detector.

Call your attention to the following problems

*Never dismount or refit the dynamic balance detector by yourself.

*The part of rotational shaft should be prevented from any strike.

*The dynamic balance detector can be restarted only 5 seconds later after shut down.

*On the top of dynamic balance detector never put many heavy substances.

*Please refer the content of self-calibration in case of abnormal operation. Cut off the power supply and pull out the plug immediately, if the noise, smoke or any other accidents take place suddenly, then inform the relevant service man.

*In front of the power socket of the dynamic balance detector, space must be left so that you can rapidly pull out the plug.

*The dynamic balance detector can't be used beyond the scope of its functions stipulated in the manual.
1. Technical Data

2. The balance weight plumb (block) used in the detector

2.1 Stacked package of balance weight plumb.

(Ordinary steel rim section and aluminum alloy rim section)

2.2 Stuck balance weight plumb.

(Aluminum alloy rim section)

Note: The errors in balance weight plumb directly affect the tested result of the detector.

3. Main components of CB series dynamic balance detector

- Bench
- Side cover plate
- Front view
- "A" Distance gauge
- Side cover plate

Diagram: Side view and Front view of the detector components.
4. Knobs and indicator Lamps on Controlling Panel

1. **A** Distance setting knob. Press down + - to adjust the setted distance value on indicator.

2. **L** Width setting knob. Press down + - to adjust the setted width value on indicator.

3. **D** Dia setting knob. Press down + - to adjust the setted Dia value on indicator.

4. **<5g** High precision balance knob. Indicator displays "00" when unbalance<5g, press down this knob to show the left unbalance value.

5. **R** Knob for automatically test the inputting value.

6. **F** Knob for static balance and selecting the position & mode of ALU balancing block.

7. **STOP** Knob for emergency shut down.

8. **START** Starting knob.

9.10. **Value display indicator.**

11.12. **Positioning lamp for unbalance point.**

13. **Balancing block mode indicating lamp.**
1. **Distance setting knob.** Press down to adjust the setted distance value on indicator.

2. **Width setting knob.** Press down to adjust the setted width value on indicator.

3. **Dia setting knob.** Press down to adjust the setted Dia value on indicator.

4. **High precision balance knob.** Indicator displays "00" when unbalance<5g, press down this knob to show the left unbalance value.

5. **Knob for automatically test the inputting value.**

6. **Knob for static balance and selecting the position & mode of ALU balancing block.**

7. **Knob for emergency shut down.**

8. **Starting knob.**

9. **Value display indicator.**

10. **Positioning lamp for unbalance point.**

11. **Balancing block mode indicating lamp.**
5. Basic operation of balance detector and selection of functions

5.1 Wheel balancer

5.1.1 Turn on the power switch on the left side of the detector, indicator 9 displays "CB2", 10 show "00", and then the indicators 9, 10 change to "A", "8.0".

5.1.2 Mounting of tire
Select the positioning cone that fits the central hole of the rim, to install it at the center of rotational shaft, then tighten and lock it with the handle nut.
(The maximum weight of wheel should not more than 70kg.)

5.1.3 Input the value A
Pull the distance gauge A to the position, where the balance block is to be setted. Press + - knobs and input the reading on the gauge into indicator 10, meanwhile the indicator 9 should display the value as "A".

5.1.4 Input the value L
Use the width gauge that taken from the accessories to measure the width between two sides of the rim, press + - knobs to input the reading on the gauge into the indicator 10, meanwhile the indicator 9 should display the value as "L".

5.1.5 Input the value D
After the value of Dia. confirmed, press + - knobs to input the value into the indicator 10, meanwhile the indicator 9 should display the value as "D".

5.1.6 Press the starting knob to start the operation; several seconds later, the detector will automatically stop. (Pull down the protection hood, the detector of B type will automatically start up.)

5.1.7 Display the unbalance value
The value displayed by indicators 9 and 10 is the value of unbalance, rotate the wheel by hand, the positioning lamps 11, 12 will constantly flash.

5.1.8 Right till all lamps in a set of 11 or 12 start to light, it means that the position of rim's highest point is the unbalance point. Among which the 11 represents the value of internal rim side and the 12 represents the value of external rim side.

5.1.9 At the unbalance point of the rim, mount a balance block corresponding to the measured value, the indicator 9 represents internal side of the rim, while the indicator 10 represents the external side of the rim.

5.1.10 Repeat the procedure 6-10 till the indicators 9 and 10 show "00".

5.1.11 Dismount the tire from the rotational shaft, the balance detection is now finished.
Selection of functions

This lamp lighting shows that it is adapt to the tires used for motorcycle, or those wheels at both sides of which placing the balance block is not allowed.

This lamp lighting shows that it is adapt to the alloy rim, at the shoulder of which the balance block can be stuck on.

This lamp lighting shows that it is adapt to the alloy rim, on the external hidden side of which the balance block can be stuck on.

This lamp lighting shows that on the external side of which the balance block can be stuck on, and at the internal side of the rim, the balance block can be braced or inserted.

When the four sets of indicators all went out, it shows the standard balance. (When ever you start the detector, the computer automatically set at such state.)

5.2( )WHEEL BALANCER

5.2.1 Turn on the power switch on the front panel.
The indicator 9 displays "850" and then indicators 9.10 change into "A","8.0".

5.2.2 Mounting of tire:
Select the positioning cone that fits the central hole of the rim, to install it at the center of rotational shaft, then tighten and lock it with the handle nut.
(The maximum weight of wheel should not more than 70kg)

5.2.3 Input the value "A"
Pull the distance gauge A to the position, where the balance block is to be setted.
Press keys and input the reading on the gauge into indicator 10, meanwhile the indicator 9 should display the value as "A"

5.2.4 Input the value "L"
Use the width gauge that taken from the accessories to measure the width between the two sides of the rim, press keys to input the measured width into indicator 10, meanwhile indicator 9 should display the value as "L"

5.2.5 Input value "D"
After the value of rim Dia confirmed, press keys to input the value into the indicator 10, meanwhile the indicator 9 should display the value as "D"

5.2.6 Press the starting knob to start the operation.
7 seconds later after starting, the detector will automatically stop. (Pull down the protection hood, the detector of B type will automatically start up.)

5.2.7 Display the value of unbalance
The value displayed by indicators 9 and 10 is the value of unbalance. Rotate the wheel by hand, the positioning lamps 11 and 12 will constantly flash.
Selection of functions

This lamp lighting shows that it is adapt to the tires that used for motorcycles, or those wheels on both sides of which placing the balance block is not allowed.

This lamp lighting shows that it is adapt to the alloy rim, at the shoulder of which the balance block can be stuck on.

This lamp lighting shows that it adapts to the alloy rim, on the hidden external side of which the balance block can be stuck on.

This lamp lighting shows that on the external side of which the balance block can be stuck on, and on the internal side of the rim the balance block can be braced or inserted.

When the four sets of the lamps all went out, it shows a state of standard balance (Whenever you start the detector, the computer will automatically set at such state.)

6. Counter positioning

Counter positioning method is a widely used method. It is applicable to common steel rims and aluminum alloy rims. Especially for the new rims, and it can provide high balance precision.

Procedures of counter positioning:

Place the spring with the bottom toward the balancer → Place a suitable cone → Place the wheel → Plastic cup → Quick bolt cap
7. Self-calibration

When there is doubt in the precision of the measured value this function can be used. Don't shut down the detector during the operation, because it may cause the inputting of the wrong value. (Don't arbitrarily use this function)

Procedures in operation:

1. Mount the balanced tire.

2. Press down the "R" knob, after about half a second, press the starting knob. The indicators 9 and 10 show "CAL" - "CAL", the positioning lamp of unbalance will flash several seconds, and then went out automatically.

3. Press down the starting knob, after several seconds the detector automatically stop, the indicators 9 and 10 show "Add" - "100". Add a balance block of 100g at any point of external side of the rim.

4. Press this knob, the wheel will rotate, the indicators 9 and 10 show "End" - "CAL", the calibration is complete.

8. Standard accessories of CB Series Tire Dynamic Balance Detector

- Positioning cones for axis
- Thread rod
- Plumb 100g
- Quick bolt cap
- Calipers
- Spring
- Plastic cup

9. Optional accessories of CB Series Tire Dynamic Balance Detector

- Protection cover
- Extra-large cone
- flange
10. Standard accessories (List)
*Counterweight nip 1 Piece
*Caliper 1 Piece
*Positioning cone for axis 3 Pieces
*Quick bolt cap 1 Piece
*Thread rod 1 Piece
*Plumb 100g 1 Piece
*Plastic cup 1 Piece
*Spring 1 Piece
